Features not working / not implemented

DSP Stroke Prediction - Defense 2 - everything not listed here is demoed from the main branch

Feature	Status
Drift-triggered retraining (bonus)	Not implemented. Retraining is scheduled (every 10 min) and gated on the number of new good_data files.
Real ground-truth labels	Simulated: labels of ingested rows are looked up in the labelled reference dataset (ingested files carry no label by design).
[VERIFY BEFORE SUBMITTING] anything that failed in your own end-to-end run	Replace this line: list every feature that does not work on `main` (e.g. Grafana alert delivery to Teams, a dashboard panel, a DAG task). If everything works, delete this row and write: 'None known'.

Who did what (Defense 2)

Each member answers questions about the features listed in their row

Member	Workstream	Tasks
[Person A]	Model registry and serving	MLflow service + bootstrap (baseline champion), model loading from models:/stroke_model@champion, POST /reload-model, GET /model-info, thread-safe model holder, custom Airflow image, compose wiring
[Person B]	Training pipeline	training_dag (load_data, train_model, save_training_stats, evaluate_candidate, promote_to_champion, notify_api_reload, archive_data), promotion rule, fixed test set, training_stats table and drift baseline
[Person C]	Monitoring (Grafana)	Data-quality dashboard, drift and prediction dashboard, 6 alert rules, Teams contact points and routing, provisioning as code, SQL tests, traffic simulator used to populate the dashboards
[Person D]	Data Docs, alerts, CI/CD	nginx serving Data Docs + report links, two Teams channels (Adaptive Cards), CI extension, CD release workflow (semantic versioning), demo files, README and documentation
